MsGT: Multi-scale Geometry and Topology Feature Extraction for Point Clouds

Authors: Kean Fallon | Xiwen Jiang | Melchior N'Bouke | Ryu Ueno | Changyu Zhou

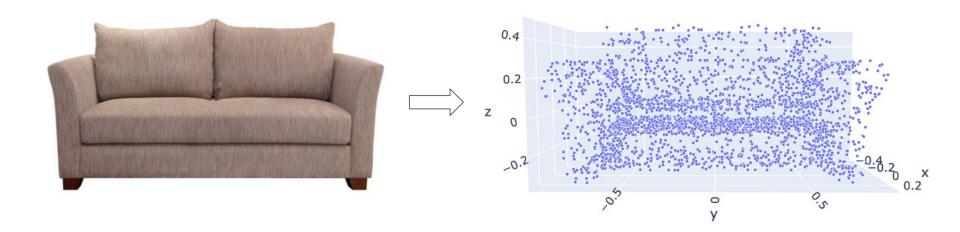

Academic Mentors: Dr. Shunsuke Kano | Dr. Masaki Ogawa

Industry Mentors: Dr. Masashi Yamazaki Mr. Akinobu Sasada

• Background

- MsGT Architecture: Our method
- Implementation
- Evaluation
- Future Work

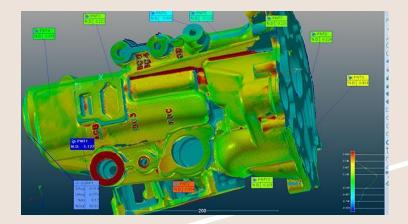

The Idea

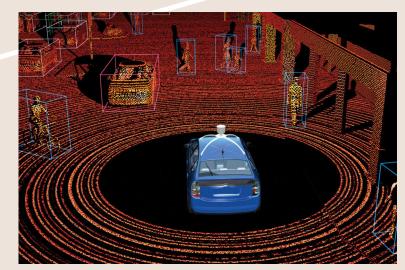

Many Applications...

- Urban Planning and Infrastructure
- Construction and Design
- Manufacturing/Quality Control
- Autonomous Systems
- Data Collection

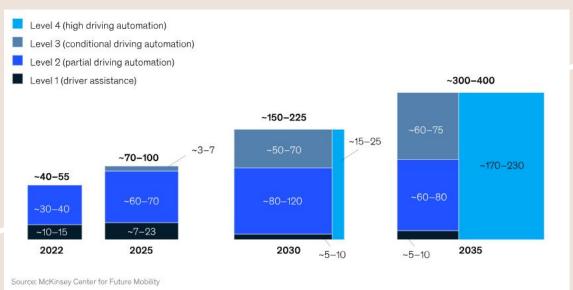

...Strong Economic Impact

- New Business Opportunities
- Cost Reduction
- Increased Efficiency
- Asset Management
- Risk Mitigation

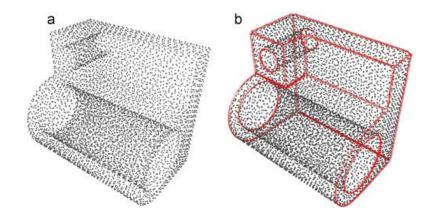

Automated driving: Projected size of industry in billions (USD)

Point Cloud Processing

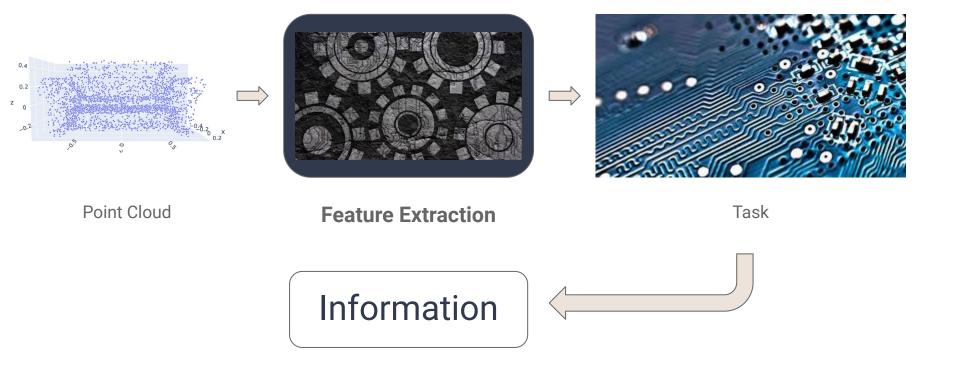

- Point Cloud = Data
- Point Cloud + Processing =

INFORMATION

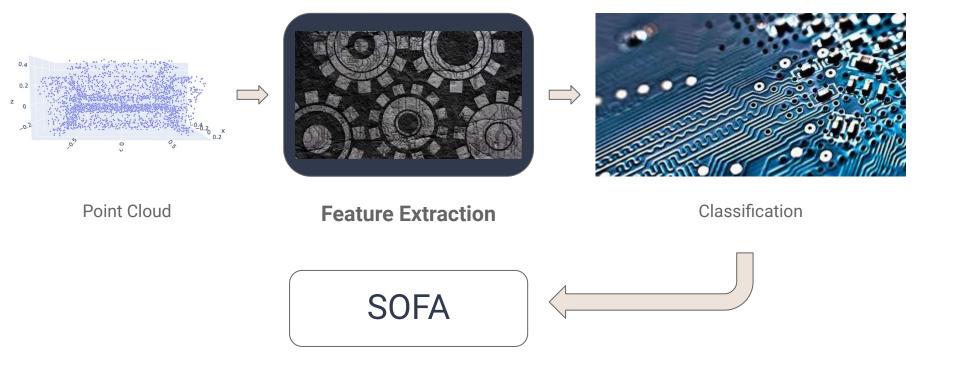

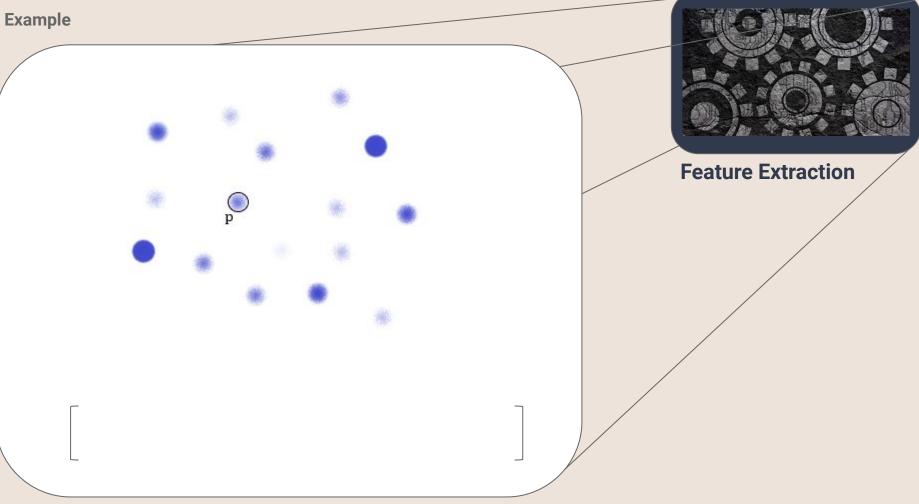

INFORMATION \leftarrow **"FEATURES"**

How It Works

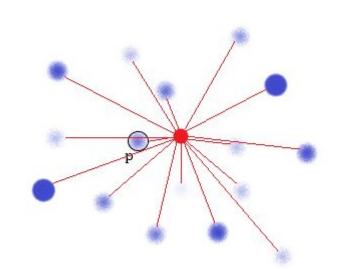

How It Works

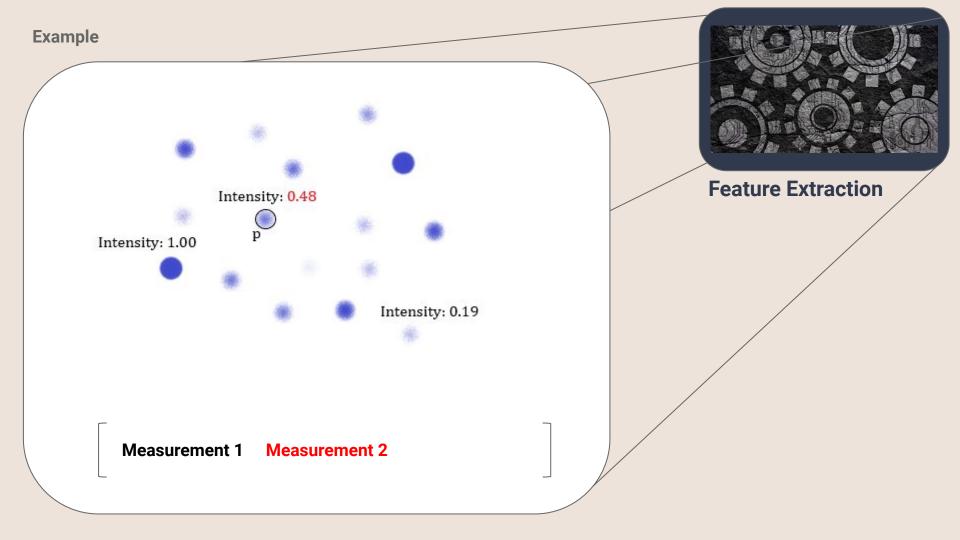

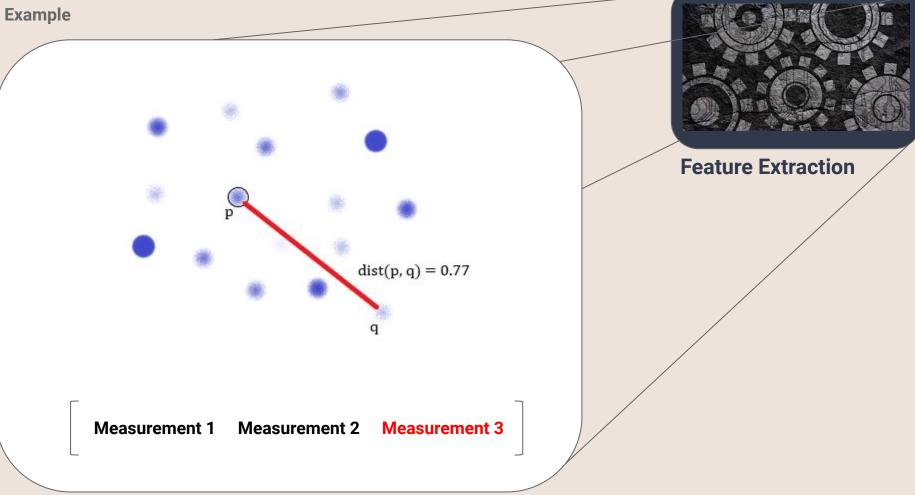

Example

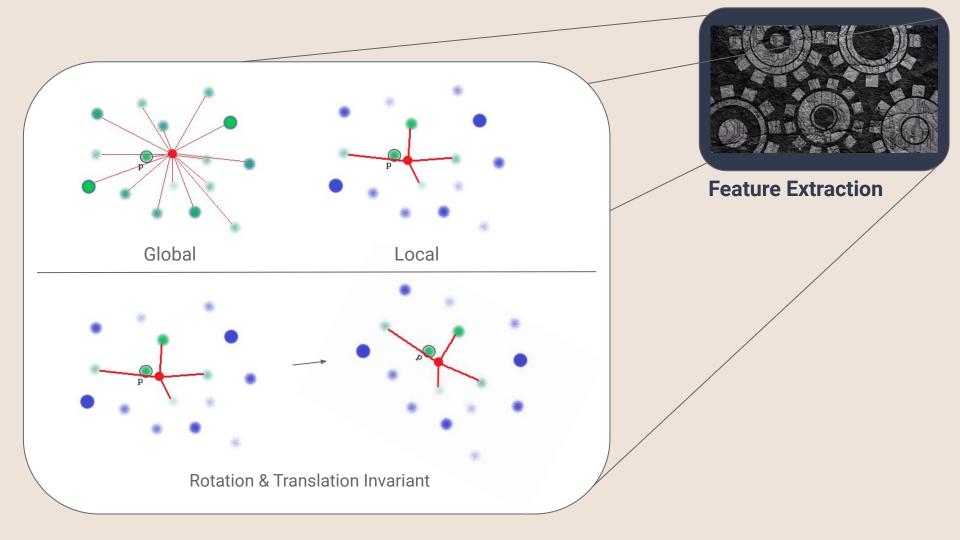

Feature Extraction

Measurement 1

Two Ways

Hand-Crafted Methods

- First on the scene (Old)
- Mathematics and statistics
- Does some tasks well, but is **limited**

Deep Learning Methods

- New (**PointNet** 2017)
- Computer Science and Machine Learning
- Does many tasks **very well**, but is **expensive**

WHAT THIS TALK IS ABOUT: MsGT: Feature Extraction Method

- Performs better than existing hand-crafted methods
- Introduces novel mathematics for point cloud processing
- Strong accuracy for several data classes
- No deep learning

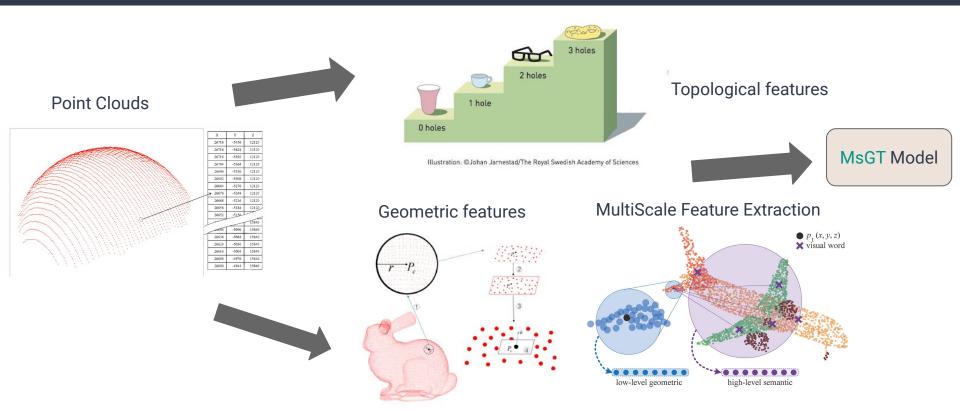

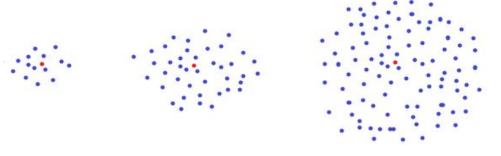

- Background
- MsGT Architecture: Our method
- Implementation
- Evaluation
- Future Work

MultiScale Topology and Geometry

Multi-scale Topology and Geometry

- Extract global features via topology (persistent homology, etc.)
- Extract local features via geometry
- Extract local features at different scales

Concatenate them:

$$feature \ vector = \left[\begin{array}{c} global \ \middle| \ local_1 \ \middle| \ \cdots \ \middle| \ local_n \end{array} \right]^T$$

Significance: Most methods focus only on topology or geometry, not both.

Persistent Homology (TDA)

Persistent homology is the flagship tool of topological data analysis (TDA). **Definition:** Persistent homology computes the topological features present in given data.

• Filtration

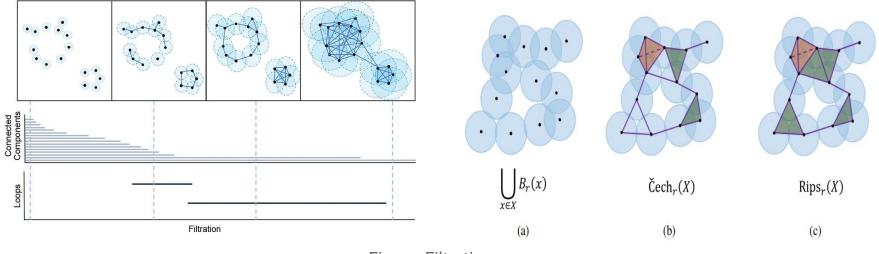

Figure: Filtration

Persistence Diagram (PD)

• Persistence Diagrams (PD) = (birth, death)

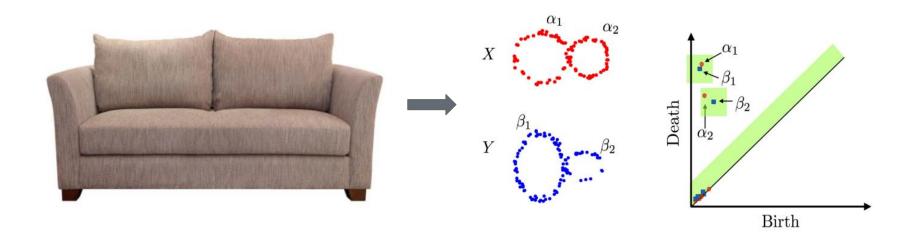

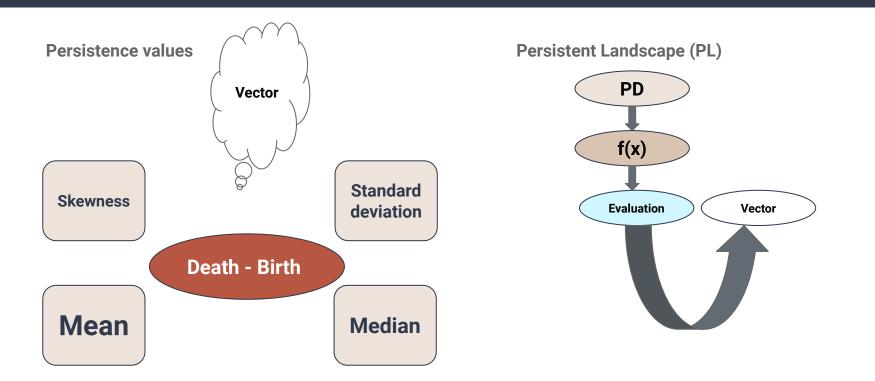

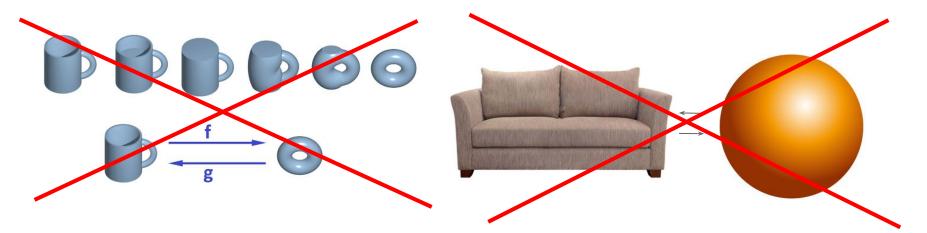

Figure: Persistence Diagram

Vectorization of the PD

Geometry: Local Features

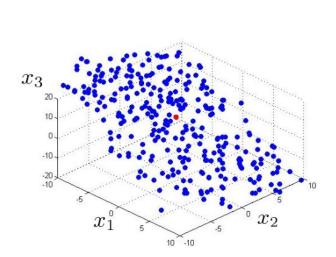

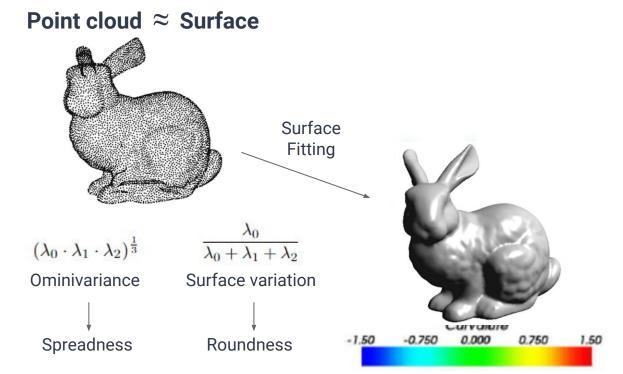

Geometry detects: curvature, distances, etc.

Geometry on point clouds \rightarrow Local features

Geometry: Local Features

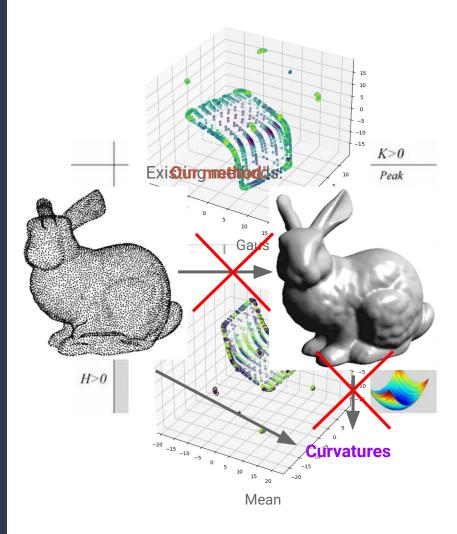

Geometry: Local Features

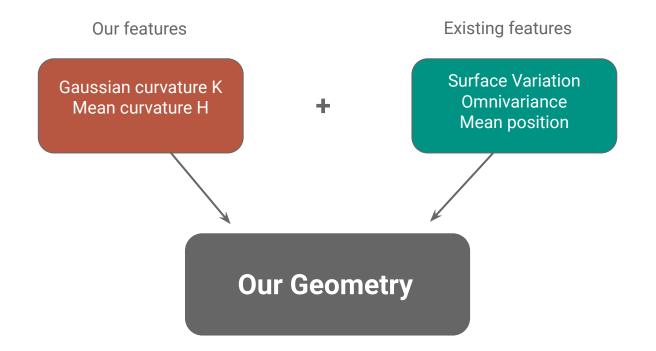

Gaussian curvature & Mean curvature = Shape of a Surface

Our Gaussian and Mean curvature on pointcloud:

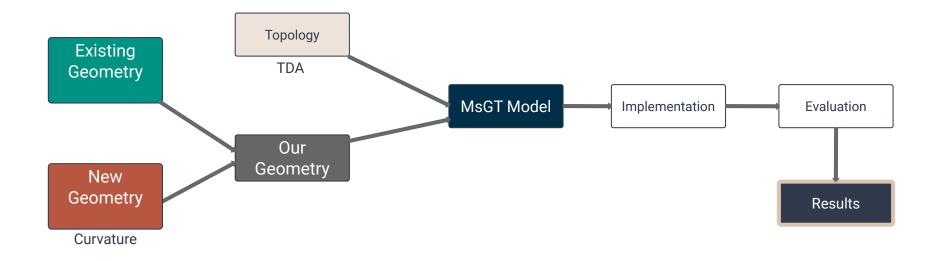

$$\begin{split} \mathcal{K}_p &= \left(\prod_{i=1}^n k(p,q_i)\right)^{\frac{1}{N}}, \\ \mathcal{H}_p &= \frac{1}{n} \sum_{i=1}^n \left(k(p,q_i) \cdot \frac{\langle \mathsf{n}(q_i), (p-q_i) \rangle}{\|\mathsf{n}(q_i)\| \cdot \|p-q_i\|}\right). \end{split}$$

Geometric features we used:

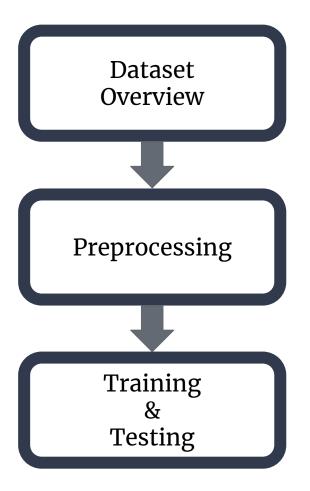

Multi-scale Geometry Topology (MsGT)

- Background

- Future Work

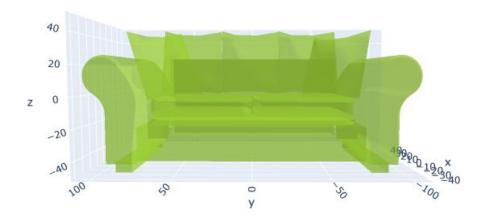

Implementation

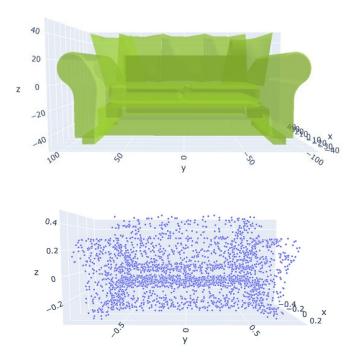

Dataset Overview

- ModelNet10 dataset
 - Training:
 - Size: 3991
 - Training classifiers
 - Testing:
 - Size: 908
 - Evaluating performance of extracted feature vectors
- A benchmark in 3D object recognition
- 10 object categories

Preprocessing Steps

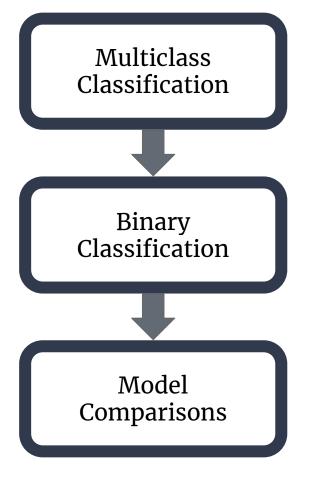

- Sampling:
 - o 1024 points
 - ensure consistent input size
- Normalization:
 - rescale the point coordinates
 - lie within a common range
- Noise Addition:
 - introducing small variations
 - mimic real-world scenarios

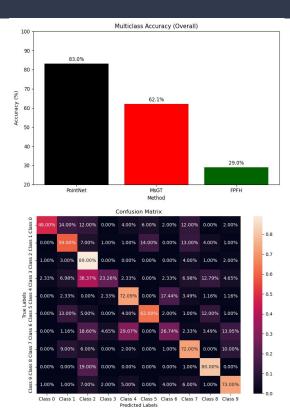

- Background
- MsGT Architecture: Our method
- Implementation
- Evaluation
- Future Work

Model Evaluation

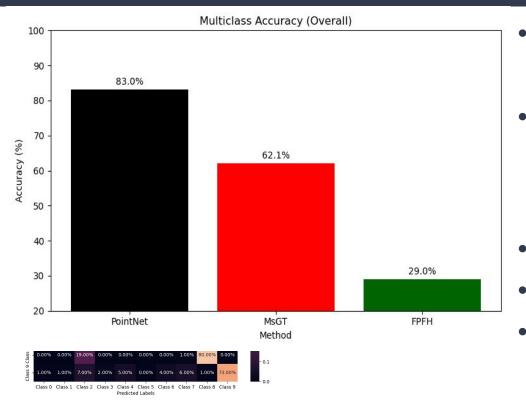

MsGT stands out among other

handcrafted methods

• MsGT lags behind **deep learning**

approaches

- High Accuracy in Specific Classes
- Challenges with Low-Quality Data
- Insight into Misclassifications

Binary Classification and Model Comparison

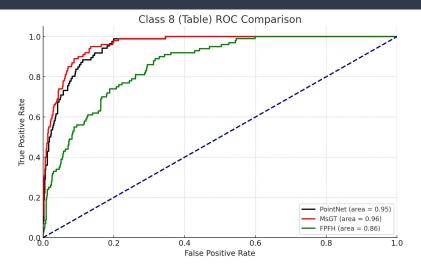

- High Accuracy Across Classes
- Superior to Other Handcrafted

Methods

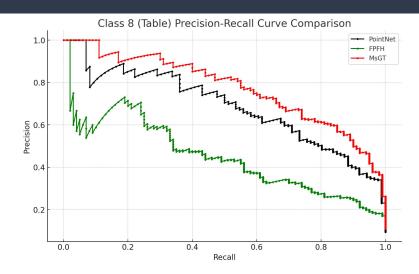

• Exceptional Performance in Table

Class

Table Binary Classification: MsGT > PointNet > FPFH

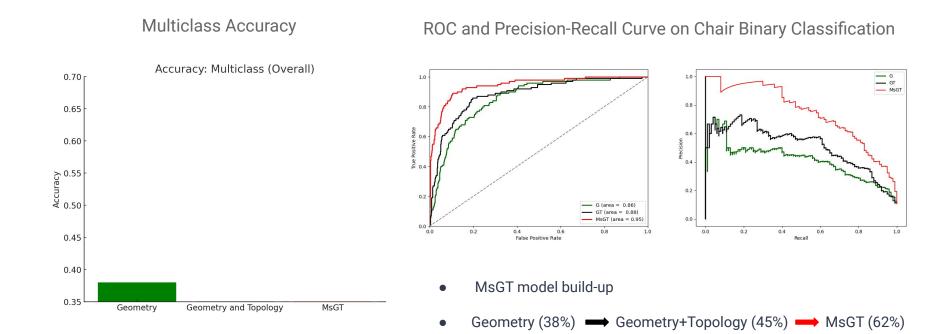

- The ROC curve for MsGT is close to the top left corner.
- AUC = 0.96: high effectiveness in distinguishing between positive and negative samples.

- MsGT Precision-Recall Performance
- Effectively detect the majority of positive samples while keeping false positives low

Geometry < Geom+Topo < MsGT Comparisons

- Other pairs of some existing geometric features (Black)
- Gaussian and Mean > other geometry methods

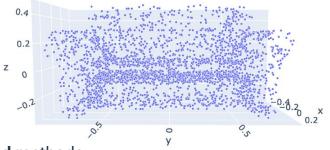

Conclusion

• MsGT Method:

- **Combines** topological and geometric features.
- **Cost-effective** compared to deep learning.
- Performance Comparison:
 - Superior to **PointNet** in specific tasks.
 - Significantly better than FPFH and other **handcrafted** methods.

• Key Advantages:

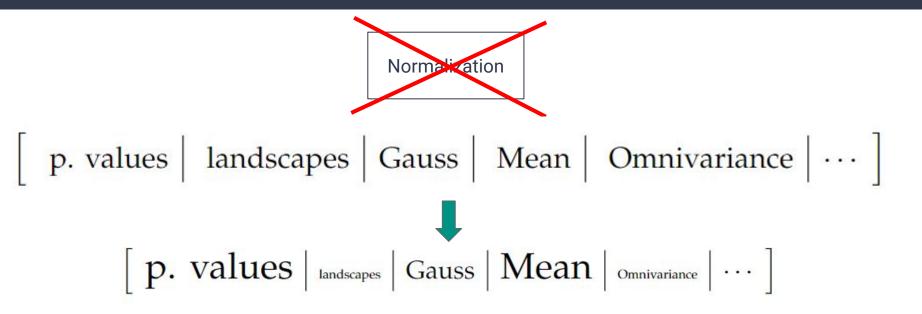

- **High accuracy**, especially in challenging categories (e.g., table classification).
- Balanced **integration** of topological and geometric strengths.
- Practical Implications:
 - Low cost and high efficiency for various applications
- Model Limitation:
 - Misclassifying certain classes in multiclass classification
 - Computational time
